

◆ 1. Standard Professional Introduction (General)

"Hi, I'm Sandeep Lodhi, a MERN Stack Developer with over two years of experience in building full-stack web applications and scalable APIs. I've worked on diverse projects—from logistics and real estate to e-commerce and edtech—for clients across Israel, the US, Spain, and Australia.

I specialize in React, Node.js, Express, and MongoDB, and I'm comfortable with CI/CD workflows, serverless functions like AWS Lambda, and modern frontend libraries like Redux Toolkit and Tailwind CSS.

I'm passionate about writing clean, maintainable code and love collaborating with teams to solve real-world problems through tech. I'm now looking for a role where I can continue learning and contribute to impactful, scalable solutions."

✔ 1. Why Should We Hire You?

General Professional Version:

"You should hire me because I bring a strong balance of technical expertise, adaptability, and ownership. With over two years of experience in full-stack development, I've successfully built and delivered scalable applications across diverse domains like e-commerce, real estate, logistics, and education.

Beyond just coding, I understand product needs and user experience. I've worked with international teams, managed deployments, integrated APIs, and led projects using tools like React, Node.js, AWS, and Docker.

I'm not just looking for a job—I'm looking to contribute, grow, and solve meaningful problems alongside a great team."

✔ 1. Why did you leave Shaligram Infotech?

After completing my training as a Software Developer, the company's internal requirements changed, and they wanted to assign me to a non-development role, like UI/UX and manual testing. While I respect those areas, I was specifically trained and passionate about full-stack development, and I wanted to grow in that direction. Additionally, the role was located far from my hometown, and I was looking for something closer and more aligned with my core skills.

✓ 2. Why did you leave MSAI Research Labs?

I was working on a major project for a client, and once the project was completed, the client took ownership of the codebase and operations. As a result, the development team, including myself, was released, and the company shifted focus to other regions, including their US operations. It was a great experience, and I learned a lot during my time there.

✓ 3. Why did you leave Morpheme Webnexus Pvt. Ltd.? (Latest Company)

At Morpheme, I worked on some exciting full-stack projects, improved my DevOps skills, and gained experience leading deployments. However, I felt that I had reached a point where I wanted to work on more product-driven or long-term scalable systems, possibly in a larger or more stable team environment. So I started looking for an opportunity where I can grow both technically and professionally with more complex challenges.

✍ Final Summary Script (If Asked All Together):

"I began my career at Shaligram Infotech, where I was trained as a Software Developer. However, due to internal reshuffling, I was offered a different role that didn't align with my technical training, so I decided to move on. At MSAI, I worked on a project that was eventually handed over to the client, leading to restructuring and team release. At Morpheme, I gained strong MERN and DevOps experience, but I'm now looking for a more product-focused role where I can work long-term and grow further."

? HR Question 4: Why are you looking for a new job now?

✓ Ideal Answer:

"I'm looking for a role where I can build high-impact products, work in a strong engineering team, and continue improving my skills in areas like architecture, performance, and scalability. I've reached a point where I'm ready for the next challenge."

✓ TorahAnytime (Lead Developer Role)

***“TorahAnytime is a religious media and donations platform primarily serving users in the US. I worked as a lead developer on this project. My role involved managing the development workflow—assigning tickets, reviewing pull requests, merging code, and deploying to production.

I also helped resolve technical issues, mentored junior developers, and contributed to building new features. The tech stack included React.js, Node.js, and MongoDB, with AWS for deployment. My work helped improve release speed and team coordination.”**

✓ BikeShopShippers

***“BikeShopShippers is a logistics management platform. I built a dashboard for bulk shipment management, implemented role-based access control, and configured CI/CD pipelines for smooth releases.

I also managed GitHub boards to track development progress and coordinate with stakeholders. This helped improve the delivery efficiency for the logistics team.”**

✓ Nosotrus (LMS System)

***“Nosotrus is a learning management system for Spanish-speaking schools. I built interactive dashboards tailored for different roles—admins, teachers, parents, and students.

I also set up CI/CD pipelines using Bitbucket, integrated error monitoring with Sentry, and managed communication and task tracking via Jira and Slack. This helped streamline development and reduced bugs in production.”**

✓ FamilyOne

***“FamilyOne is a discount and networking platform connecting families with local businesses. My main contributions were developing user registration flows, linking family profiles to businesses, and performing API load testing.

I also integrated an AI-based chat system using Intercom for customer support. This improved user engagement and reduced manual support queries.”**

✓ ShowTrail (Extension of FamilyOne)

****“ShowTrail is built as an extension of the FamilyOne platform and focuses on promoting coupons. I worked on building a coupon-sharing ecosystem and automated customer support features using Intercom workflows.**

The goal was to boost customer retention and ease operational overhead.”**

✓ Real Estate Platform

****“This project is a full-featured real estate platform developed using the MERN stack along with Firebase. It supports buying, renting, and selling properties.**

I handled the backend using Node.js, Express, and MongoDB, built a responsive frontend with React and Redux, and integrated Firebase for image storage and authentication.

The platform includes dynamic property listings, filters, and owner-agent dashboards.”**

✓ Perk

****“Perk is an event management platform where I built a custom PDF editor for mapping event layouts. I also developed a serverless system for event registration and layout management.**

It was designed to handle events of various scales and allowed organizers to customize their venue layouts easily.”**

✓ SmartBiz

“SmartBiz is an event onboarding tool for businesses. I designed a dynamic form builder that adjusts according to business sector needs, making the onboarding process simple and flexible for users from different industries.”

✓ E-commerce Platform

***“This is a full-fledged e-commerce application I built from scratch using the MERN stack. It includes user authentication, real-time product listings, a shopping cart, and payment gateway integration.

I also implemented order tracking and product management for admins. We followed Agile methodologies with daily standups, sprint planning, and regular retrospectives to ensure timely delivery.”**

? Q1: Can you tell me about a project you're proud of?

A:

"Sure. One of the projects I'm proud of is *TorahAnytime*, a religious media platform. I was the lead developer there, managing the project workflow—assigning tasks, reviewing PRs, and handling deployment.

I also contributed to building new features and guided junior developers. The platform handled live video content and donation processing, so reliability and uptime were critical. We used the MERN stack and deployed via AWS. My contribution helped streamline the release cycle and improved overall team efficiency."

? Q2: What challenges did you face on the FamilyOne project?

A:

"FamilyOne involved connecting families to businesses offering discounts, and one major challenge was handling dynamic user linking and ensuring data consistency across large volumes.

I also had to load test the API under simulated high-traffic scenarios to ensure stability. We integrated AI-based chat support using Intercom, which greatly reduced customer support load. It pushed me to optimize both backend performance and frontend responsiveness."

? Q3: Can you describe the real estate project technically?

A:

"Yes. This was a full MERN stack project. On the backend, I used Node.js and Express.js to build RESTful APIs for property listings, user accounts, and filtering. The database was MongoDB, and Firebase was used for image storage and user authentication.

On the frontend, I built dynamic interfaces using React and Redux, with features like search filters, map views, and user dashboards. It was deployed on Render and helped users list, search, and manage real estate properties."

? Q4: How do you work in a team while building a project?

A:

"I usually work with Git and GitHub for collaboration, using feature branches and pull requests. We follow Agile with daily stand-ups and sprint planning. I've used tools like Jira, Slack, and ClickUp to stay aligned with product and design teams.

For code quality, I implement linting and Prettier, and sometimes set up automated testing or CI/CD using GitHub Actions or Bitbucket pipelines. Clear communication and early feedback help me work effectively with cross-functional teams."
