

01 — Self Introduction ("Tell me about yourself")

This is the first question in almost every interview. It sets the mood for the whole interview. Practise it until it sounds natural, not memorised.

Simple formula: Who I am → Experience summary → Current work → Key strengths → What I want next.

1. Technical round — 1 minute (use this most often)

"Good morning. Thank you for this opportunity.

My name is Sandeep Lodhi. I'm a Node.js backend developer with almost 4 years of experience in building REST APIs, backend services and full-stack MERN applications.

Currently I'm working at **Atiya Healthcare** in Delhi. There I build backend systems for a large healthcare call centre — a Hospital Appointment CRM, a WhatsApp automation platform using Exotel APIs, reporting dashboards and automation jobs. I work with Node.js, Express, SQL Server, PostgreSQL, MongoDB and Redis, and I also handle deployment on IIS and Cloudways.

Before this, at **Morpheme Webnexus**, I worked on AWS Lambda serverless backends and CI/CD, and I led an Israeli client project called **TorahAnytime**, where I reviewed and merged PRs and deployed to production.

My strengths are API design, database query optimisation and production debugging. For example, I reduced a slow report query from about 92 seconds to around 300 milliseconds.

Now I'm looking for a backend-focused role where I can work on scalable systems and grow as a Node.js engineer. That's a short summary about me."

2. Short version — 30 seconds (telephonic / screening round)

"Hi, I'm Sandeep Lodhi, a Node.js backend developer with almost 4 years of experience. I work mainly with Node.js, Express, MongoDB, SQL databases and Redis. Currently at Atiya Healthcare I build CRM and WhatsApp automation backends for a healthcare call centre. Earlier I worked on AWS serverless projects and led an Israeli client project at Morpheme Webnexus. I'm looking for a backend role where I can build scalable systems."

3. Full career journey — 2 minutes (when they say "walk me through your career")

"My name is Sandeep Lodhi. I completed my B.Tech in Computer Science from Technocrats Institute of Technology, Bhopal, in 2023 with 8.7 CGPA.

I started my career at **Shaligram Infotech, Ahmedabad**, as a software developer. There I built my foundation in JavaScript, jQuery, Bootstrap and MS SQL Server, and I worked on optimising APIs and SQL queries.

Then I joined **AB MSAI Research Labs** in Delhi as a MERN stack developer. There I did most of the R&D for an astrology platform from scratch — I chose the tech stack, integrated third-party astrology APIs for kundli and horoscope, and built chat, audio and video communication features. I also built and deployed **ThePNAC.com** end to end using PM2 and NGINX.

After that I joined **Morpheme Webnexus**, where I moved deeper into backend and cloud. I built serverless APIs on AWS Lambda with TypeScript, set up CI/CD with Sentry and Codecov, did load testing with JMeter, and led the **TorahAnytime** project for an Israeli client — assigning tickets, reviewing PRs and deploying to production. In parallel I built **BikeShopShippers**, a logistics platform on Medusa.js with Stripe and UPS integration.

Currently I'm at **Atiya Healthcare**, where I own backend systems end to end — the Hospital Appointment CRM, a real-time WhatsApp platform with Socket.IO, reporting on tables with 50 million+ rows, and automation jobs. I gather requirements, design the APIs and database queries, build, deploy and support them in production.

I enjoy backend engineering the most — performance, clean architecture and solving real business problems. That's why I'm looking for a backend-focused Node.js role now."

4. HR round version (more personal, less technical)

"Thank you for giving me this opportunity to introduce myself.

My name is Sandeep Lodhi. I'm from Ashok Nagar in Madhya Pradesh, and I come from a farming family. I completed my schooling in Lalitpur and my B.Tech in Computer Science from Technocrats Institute of Technology, Bhopal, with 8.7 CGPA.

I have almost 4 years of experience as a software developer, mainly in Node.js backend and the MERN stack. I've worked with 4 companies and with clients from Israel, Spain, the USA and Australia. Currently I'm working at Atiya Healthcare in Delhi.

As a person, I'm hard-working, I take ownership of my work and I enjoy learning new technologies. In my free time I like playing cricket and guiding students who are starting in programming.

I'm looking for a stable, long-term role where I can grow and contribute to the company. Thank you."

5. Backend / product-company version (strong technical focus)

"I'm Sandeep, a backend developer focused on Node.js. Over almost 4 years I've built REST APIs, background job systems, real-time messaging and data-heavy reporting.

A few things I've built recently: a WhatsApp platform where Exotel webhooks are stored in MongoDB and pushed to agents in real time with Socket.IO; a reporting platform with 45+ reports on tables with 50 million+ rows, using ETL sync, Redis caching and BullMQ workers; and a cron service with safety guards that pushes dropped calls back into dialer campaigns.

I care about performance and reliability — indexing, caching, retries with backoff, idempotent webhooks, health checks and graceful shutdown. I'd like to bring this to a team building scalable products."

6. Tips for speaking

Do	Don't
Smile and keep eye contact (look at the camera on video calls).	Don't read from the screen.
Speak at a medium speed. Pause between companies.	Don't rush to finish in 20 seconds.
Mention 1 number (92 s → 300 ms, 45+ reports).	Don't list 25 technologies in one breath.
End with what you want next.	Don't say anything negative about your current company.
Keep it 60–90 seconds unless they ask for detail.	Don't tell your full family story in a technical round.

After your intro, the interviewer usually picks one thing you said. So only say things you are ready to explain — Atiya CRM, WhatsApp platform, TorahAnytime, AWS Lambda and query optimisation.

7. Common follow-ups right after the intro

"Which project are you most proud of?"

"The Hospital Appointment CRM at Atiya. I replaced an old ASP.NET system with Node.js and React on the same SQL Server databases, with 47 API modules and integrations with the dialer, WhatsApp and SMS. It's used daily by call-centre agents."

"What is your current role exactly?"

"I'm a MERN stack developer, but mostly backend. I own the full lifecycle — requirements, API and database design, development, deployment on IIS and Cloudways, and production support."

"Why backend and not frontend?"

"I enjoy problems where data, performance and reliability matter — like making a 92-second query run in 300 ms. I can do React well, but backend is where I add the most value."
